

# ETI eXpress DIGITAL/VIDEO CABLE

***Factory terminated with tellurium copper BulletPlugs® the ETI eXpress digital/video cable is a true 75 Ohm interface. It will startle even the most demanding listener or viewer with stunning resolution.***

Unlike typical 75 Ohm coax cables in which the braided shield acts as ground, the ETI Digital/Video Cable employs a separate OFC conductor as ground. The braided shield is then just that—a passive shield used to reduce RFI and EMI contaminants. As with all ETI cables and interconnects, the ETI eXpress Digital/Video Cable utilises the patented Eichmann Ratio™ formula, where the ground is larger in diameter than the signal conductor. The net result is enhanced electron flow, lower attendant jitter, and better picture quality.

Much of the enhanced resolution starts with the BulletPlug®, an ideal connector for digital or video. The BulletPlug® is a low capacitance highly coherent connector that sets new standards for resolution, electron flow, and signal integrity.

The conducting elements in the digital/video cable are solid core high purity Oxygen Free Copper (OFC), and the insulation is foamed PE and PP. All told the eXpress Digital/Video Cable is a premium product that should be considered for use in any high resolution system.
